Project 3: Responsive Design Reflection

https://jeroneill.github.io/Project/

This is the final project. This one was to make the site more responsive, but I believe I have done more changes besides responsiveness. To conform to HTML standards and accessibility, I made sure the color contrast was correct, and I don't know if it looks good, but added a media query for smartphones for when the screen gets smaller, the description text gets bigger so it doesn't hurt the eyes.

I kept text to a minimum I believe because this is a portfolio, people are honestly just going to scroll through the work and only skim at the text under it. I did debate whether I should make it multiple columns like you recommended, and then decrease in number as I make it smaller, but I realized I don't think I would be able to use the headers to describe the different images and the text being next to each other under the images might become one lengthy column without as much space next to them.

The items that need it have media queries to make them responsive like the new logo on top, hope it's better than the last one, but the way that I personally like responsiveness is when you change the size of the website, the images slowly change with it, so that's what most images still have, with minor tweaks.

As I write this, I'm still hosting the website online and it still gives me the 404 message so hopefully later on it will be fine. I followed every step perfectly, with the addition of a checklist so I hope it does. So for the site design, I tried to go with a "chill tranquil" chill being cold not calm, and an artistic and rustic feel by adding the complex work on a simple background, I doubt I accomplished any of this, but I had some compliments on the images and works I chose so I feel good about it.

You specifically said that you don't expect anything hard like a lightbox or a pop-down menu, so the way I went beyond the minimum is I added both of the things you said, with the help of some websites and tutorials.

For the images, I took or made all of them since of course it's a portfolio, the black and white model though, I took online loosely and recolored it as a project stated to do so very long ago. For the feedback I received, I followed most of it, but some of it was hard to accomplish because of how I "boxed" in some of the works, the footer I added more padding as a media query before I forget to mention, but the only one of the feedback I think I didn't accomplish was the make them columns, reasoning being what I stated earlier.

For all the screenshots of the validators, Please go to the "Reflection" folder in the submitted work in canvas with the project
